

Murray System

Breakdown of Water in Store and Commitments 15 August 2012

Resource Manager

Murray System

Breakdown of Water in Store and Commitments: Terms and Definitions

- Vic Share of Water in Storage:** The forecast share of water in the Murray system storages – Dartmouth Dam, Lake Hume, Lake Victoria and the Menindee Lakes – that is owned by Victoria, excluding water that is not available to Victoria under water sharing arrangements at the end of July. The volume held in the Victorian Mid-Murray Storages that is available to meet commitments is also included.
- Vic Share of Goulburn Valley Account:** Total amount of Goulburn system water bought by Victorian Murray system users that is yet to be delivered.
- Vic Share of Forecast Inflow to Murray System:** The Victorian share of forecast inflows in the River Murray and tributaries above the storages from the start of August.
- Vic Share of Water in Transit:** The share of the water flowing in the River Murray that is assigned to Victoria, but has not reached a Murray system storage.
- Vic Share of Evaporation:** The Victorian share of the water needed to account for evaporation from storages.
- Vic Share of River Losses upstream of SA:** The Victorian share of the water needed to account for losses from the River Murray upstream of the South Australian border.
- Vic Share of SA Dilution Flow:** The Victorian share of the water needed to account for the supply of dilution water to South Australia, as required under the Murray-Darling Basin Agreement.
- Environment:** Entitlements held for the environment, including the Barmah-Millewa Forest and lower Broken Creek operation.
- Channel Distribution Losses to 15 May 2013:** Estimate of the amount of water required to operate Victorian Murray system rural water corporations' channel and pipeline delivery systems to deliver allocation to customers and urban water corporations.
- Remaining Allocated Volume (including Carryover):** The volume assigned to all Victorian Murray entitlement holders under a 52% seasonal determination of high-reliability water shares plus the carried over resources that were allocated to entitlement holders in 2011/12, that is yet to be delivered. The volume remaining includes resources held by rural water customers and urban water corporations and water held in spillable water accounts.

Broken System

Breakdown of Water in Store and Commitments 15 August 2012

Resource Manager

Broken System

Breakdown of Water in Store and Commitments: Terms and Definitions

Water in Storage: The volume of water held in Lake Nillahcootie.

Forecast Inflows: The volume of forecast inflows in tributaries above Lake Nillahcootie that are yet to flow into the storage and the volume of forecast tributary flows downstream of Lake Nillahcootie that can meet river loss commitments. This estimate of inflows assumes there are no further rain events for the year.

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses.

Urban and Environment: Entitlements held by urban water corporations and the environment.

Remaining Allocated Volume (including Carryover): The volume assigned to water share holders under a 36% seasonal determination of high-reliability water shares, plus the carried over resources that were allocated to entitlement holders in 2011/12.

Goulburn System

Breakdown of Water in Store and Commitments 15 August 2012

Remaining Commitments

- Commitments for 2013/14
- Remaining Allocated Volume (incl Carry over)
- NRSWS Policy Reserve for 2013/14
- Channel Distribution Losses to 15 May 2013
- Trade Commitments to Murray System
- Urban and Environment
- AGL Hydro Entitlement
- Storage and River Losses
- Volume Below Minimum Operating Level

Available Resources

- Campaspe & Loddon Supplements
- Forecast Inflows to Eildon and Goulburn Weir
- Water in Storage

Resource Manager

Goulburn System

Breakdown of Water in Store and Commitments: Terms and Definitions

Water in Storage: The volume of water held in Lake Eildon, Waranga Basin and Greens Lake.

Forecast Inflows to Eildon and Goulburn Weir: The volume of forecast inflows in tributaries above Lake Eildon and Goulburn Weir that are yet to flow into storage. The volume of inflow also includes inflows for the 2013/14 season with a 99% probability of exceedance.

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity. Pumping of Waranga Basin will not be required to support allocations in the 2012/13 season.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses.

AGL Hydro Entitlement: The volume allocated to the entitlement held by AGL Hydro for the purpose of power generation that cannot be harvested in Waranga Basin.

Urban and Environment: Entitlements held by urban water corporations including Melbourne, irrigators on the lower Broken Creek and the environment (including the water quality reserve).

Trade Commitments to Murray System: Total amount of Goulburn system water bought by Murray system users that is yet to be delivered and the carried over volume of Goulburn system water obtained from water savings projects that is to be delivered to the Murray instead of diverted from the Snowy hydroelectric scheme.

Channel Distribution Losses to 15 May 2013: Estimate of the amount of water required to operate the G-MW channel and pipeline delivery systems to deliver allocation to customers and urban water corporations.

NRSWS Policy Reserve for 2013/14: The volume set aside between 30% and 50% seasonal determinations as a reserve for system operations in 2013/14 season, as required by the Northern Region Sustainable Water Strategy (NRSWS). The commitment from Waranga Basin pumping, which comprises the first 88 GL of the reserve is shown in the 'Volume Below Minimum Operating Level'. The total volume of the reserve is 275 GL (187 GL shown in the diagram plus 88 GL from the volume available from Waranga Basin pumping).

Remaining Allocated Volume (including Carryover): The volume assigned to water share holders under a 100% seasonal determination of high-reliability water shares (HRWS) plus the carried over resources that were allocated to water share holders in previous seasons, that is yet to be delivered. This volume includes water held in spillable water accounts.

Campaspe/Loddon Supplement: The volume available from the Campaspe and Loddon systems to support Goulburn allocations.

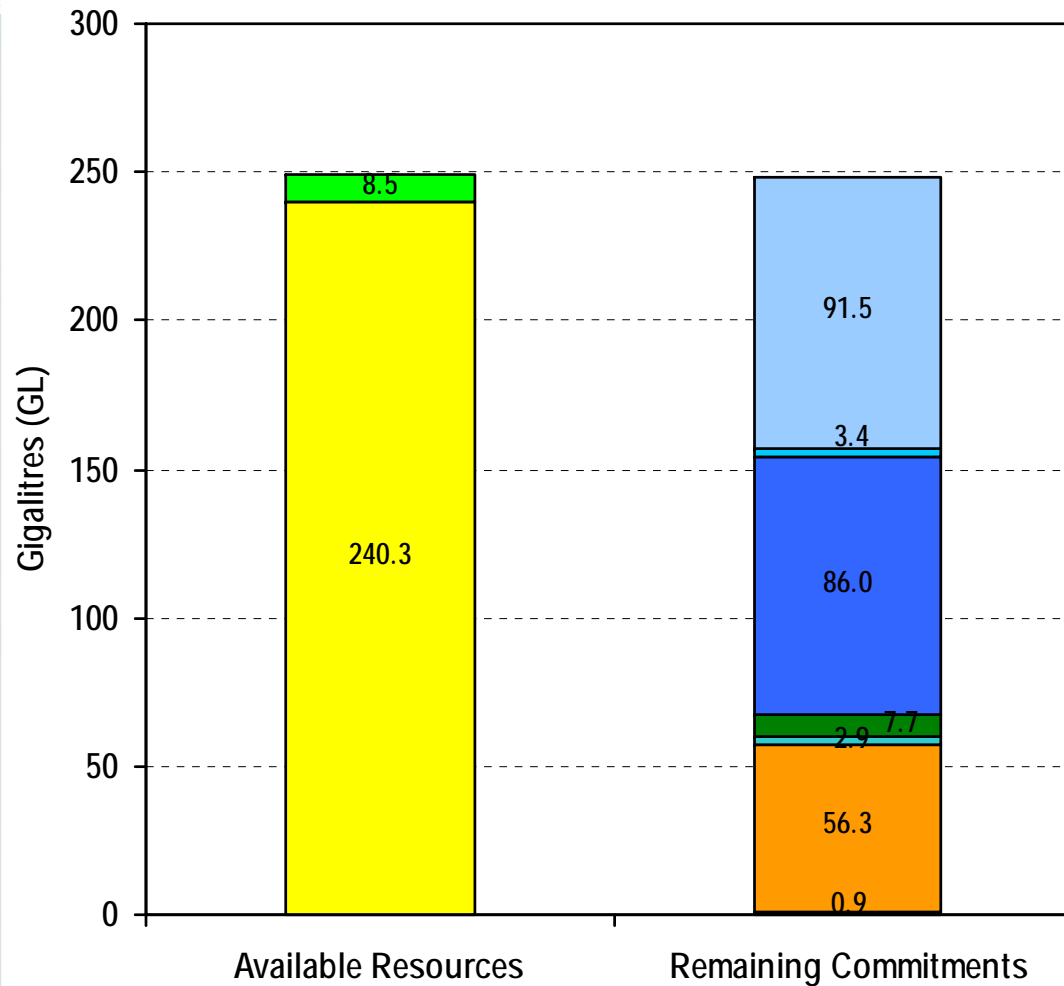

Commitments for 2013/14: The approximate volume required to provide operating requirements and allocations (up to 100% HRWS) in the 2013/14 season. The volume set aside during 2012/13 under the NRSWS Reserve Policy to meet operating commitments in 2013/14 has been included in this volume. The ability to supply all high-reliability commitments in 2013/14 is required before allocation to low-reliability water shares can be made in the current season.

Campaspe System

Breakdown of Water in Store and Commitments 15 August 2012

Remaining Commitments

- Commitments for 2013/14
- Urban and Environment
- Remaining Allocated Volume (incl Carry over)
- Trade Commitments
- Channel Distribution Losses to 15 May 2013
- Storage and River Losses
- Volume Below Minimum Operating Level

Available Resources

- G-MW Share of Forecast Inflows
- G-MW Share of Lake Eppalock

Resource Manager

Campaspe System

Breakdown of Water in Store and Commitments: Terms and Definitions

G-MW Share of Lake Eppalock: The volume of water held by G-MW in Lake Eppalock.

G-MW Share of Forecast Inflows: The G-MW share of the volume of forecast inflows for the 2012/13 and 2013/14 seasons with a probability of exceedance of 99%.

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses.

Urban and Environment: Entitlements held by urban water corporations and the environment.

Trade Commitments: The volume of Campaspe system water purchased by downstream systems that is yet to be delivered.

Channel Distribution Losses to 15 May 2013: Estimate of the amount of water required to operate the Campaspe Irrigation District channel and pipeline delivery systems.

Remaining Allocated Volume (including Carryover): The volume assigned to water share holders under a 100% seasonal determination of high-reliability water shares and a 25% seasonal determination of low-reliability water shares plus the carried over resources that were allocated to water share holders in previous seasons, that is yet to be delivered. This volume includes water held in spillable water accounts.

Commitments for 2013/14: Water that is reserved in storage to provide operating requirements and entitlements (up to 100% HRWS) in the 2013/14 season.

Loddon System

Breakdown of Water in Store and Commitments 15 August 2012

Resource Manager

Loddon System

Breakdown of Water in Store and Commitments: Terms and Definitions

Water in Storage: The volume of water held in Cairn Curran, Laanecoorie and Tullaroop reservoirs.

Forecast Inflows : The volume of forecast inflows in tributaries above the three Loddon storages that are yet to flow into storage. This estimate of inflows assumes there are no further rain events for the year.

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses and includes minimum environmental flows.

Urban and Environment: Entitlements held by urban water corporations and the environment.

Remaining Allocated Volume (including Carryover): The volume assigned to water share holders under a 100% seasonal determination of high-reliability water shares (HRWS) plus the carried over resources that were allocated to water share holders in previous seasons, that is yet to be delivered. This volume includes the water allocated to water works districts. The Loddon Bulk Entitlement requires the seasonal determination to HRWS in the Loddon to be the same as the Goulburn where the Loddon resources allow.

Commitments for 2013/14: Water that is reserved in storage to meet operating requirements and entitlements (up to 100% HRWS) in the 2013/14 season.

Supplement to Goulburn system: The volume available under the G-MW Loddon Bulk Entitlement as a supplement to support the Goulburn allocation.

Bullarook System

Breakdown of Water in Store and Commitments: Terms and Definitions

Water in Storage: The volume of water held in Newlyn Reservoir and Hepburns Lagoon

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity at Newlyn Reservoir and Hepburns Lagoon.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses and include minimum environmental flows.

Urban and Environment: Entitlements held by urban water corporations and the environment.

Remaining Allocated Volume: The volume assigned to water share holders under a 100% seasonal determination of high-reliability water shares and a 100% seasonal determination of low-reliability water shares, plus the carried over resources that were allocated to entitlement holders in 2011/12.
